⚠️ This manual applies to the KNX 4 DC/E Motor Controller WM/DRM 220 - 230 V AC starting from version B !!!

⚠️ Before installation, please read the safety instructions carefully. Failure to respect these instructions automatically invalidates warranty and all liability claims against SOMFY (e.g., wrong installation, maloperation etc.). The product must be installed by a qualified electrician! All connections have to be disconnected from mains before mounting! Make precautions against switching on by accident!

The installation of Somfy products has to be made at easily accessible places only. For maintenance and repairs which are difficult to perform because of bad accessibility (e.g., clotted or extensive clotted floors, installation behind lamps or behind façades) additional costs cannot be claimed against the seller.

A proper functioning of the Motor Controllers and motors is assured only if the animeo DC or DC/E Motor Controllers are combined with compatible Somfy motors or with motors which are expressly approved by Somfy for this purpose. In case the buyer should use motors or DC power supplies made by other producers in combination with such made by Somfy, the warranty and responsibility of Somfy will be excluded both for the Somfy product itself and its suitability as part of a functioning system as a whole. The checking and decision whether external products are suitable without restraint is exclusively within buyer’s own responsibility.
The KNX 4 DC/E Motor Controller WM 220 – 230 V AC is for controlling motors in the Concept 25 motor series (24 V DC). It is suited for the controlling of up to four individually parameterable motors for Venetian blinds or roller blinds. This Motor Controller, thanks to its integrated current supply, enables low installation costs. In combination with the Concept 25 Encoder Motor and the CTS Roll-up System Motor it facilitates especially an exact positioning of the slats and an exact positioning of the Venetian blinds. Additionally, the combination of the Motor Controller with the Concept 25 Encoder Motor offers the advantage of a longer life expectancy through protection of the Venetian blinds.

By using the animeo RTS radio module, four motors can be controlled via remote individually and across devices.

Functions and advantages

- Time saving through easy-installation, for example, with spring clips, pull relief with cable binders, sufficient clip space …
- Less wiring and space needed thanks to integrated current supply.
- A group input can be used to control all four motors independent of the ETS programming.
- Testing of running direction of the motors without ETS possible.
- The device can be used in the factory-delivered state without necessary programming via the ETS.
- The four local push button inputs can be used as maximum 8 universal KNX binary inputs, for example, to connect window contacts, temperature sensors, or occupancy detectors. Using a conventional push button, light actuators can also be controlled and dimmed. Via the dimming object, Venetian blinds can also be turned slowly.
- User-friendly and intuitive parameter settings in the ETS software.
- Intelligent switching between manual and automatic operation to guarantee excellent user-friendliness and energy savings.
- Positioning messaging of the connected motors during the move and when reaching the upper and lower end positions.
- Two free configurable security levels per motor output.
- Excess current and short circuit identification with LED display and messaging via object for each individual motor.
- LED error display when the set operational speed is not reached.
- Free configurable action at mains power return.
- Automatic cascading of the motor outputs to limit the peak current in case of mains power return and bus safety functions.
- Plug and Play! At any time extendable with the animeo RTS radio module (ref. 1860105) or animeo EnOcean Receiver (ref. 1860220). Without additional wiring the four motors, using Somfy RTS Technology, can be controlled individually per remote.
- In buildings where radio technology can not be used, such as in hospitals, radio control is also possible through animeo infrared technology.

Special advantages when using the Encoder Motor

- Settable end position of the Venetian blinds.
- Settable virtual upper end position to guarantee a visually uniform façade.
- Separate settable UP and DOWN speeds to optimise noise levels.
- Settable slats tilting speeds.
- Longer life expectancy of the end product, e.g. Venetian blinds, thanks to soft-stop function in the upper and lower end positions.
- For exact positioning of the Venetian blinds, the cycle for reference moves are freely definable per motor.
- Exactness of the Venetian blinds orientation in combination with several encoder motors.
- High level of user comfort using the wheel on the Modulis RTS hand transmitter.

⚠️ Full parameter setting and programming is only possible when there is a power supply and KNX bus voltage on the KNX Motor Controller. When only KNX bus voltage is present, only the physical address can be programmed.
All indications in the manual marked with * refers to the following terms:

**Manual order**
A manual order is a command generated by a local conventional switch or by a Somfy RTS radio hand transmitter.
A telegram received on the objects 0–7 (bit orders) is also understood as manual command.

**Automatic order**
A telegram received on the objects 8–15 (byte orders) is understood as an automatic order.

**US switch ergonomics**
With this parameter it is ensured that the Venetian blind is controlled in the US ergonomics over the local push button inputs or over the Somfy RTS radio hand transmitter.
Short pressing of the push button (< 0.5 s): A move command is carried out.
Long pressing of the push button (> 0.5 s): A turn command is carried out, as long as the push button is pressed. When released, the turn command is stopped. If the current position of the Venetian blind is beyond the turn, a move command is carried out with pressed push button.

**EU switch ergonomics**
With this parameter it is ensured that the Venetian blind is controlled in the EU ergonomics over the local push button inputs or over the Somfy RTS radio hand transmitter.
Short pressing of the push button (< 0.5 s): A turn step is carried out.
Long pressing of the push button (> 0.5 s): A turn command is carried out, as long as the push button is pressed. If the current position of the Venetian blind is beyond the turn, a move command is carried out.

**Screen switch ergonomics**
With this parameter it is ensured that the end product is controlled in Screen ergonomics over the local push button inputs or over the Somfy RTS radio hand transmitter.
Short pressing of the push button when the end product is moving: A stop command is carried out.
Long pressing of the push button when the end product is not moving: A drive command is carried out.

⚠️ This ergonomic is used to control screens, roller blinds, awnings and windows.

**DC Motors without encoder**
DC Motors without encoder have a two–wire connecting cable (white, gray).

**DC Motors with encoder**
DC Motors with encoder have a three–wire connecting cable (white, gray, purple).

**Running time (mode selection DC)**
The time, the corresponding end product needs from the upper end position to the lower end position. The time for the UP move and for the DOWN move can be individually parametered.

**Tilting time (mode selection DC)**
The time, necessary for the slats to make one complete turn.

**Running length (mode selection DCE)**
The length, the corresponding end product needs from the upper end position to the lower end position. The length for the UP move and for the DOWN move can be individually parametered.

**Turn impulse (mode selection DCE)**
Defines the time which is necessary for a complete slats turn.

**Reference move (mode selection DCE)**
A reference move is carried out with each 20th UP command after programming the end positions. Here, the Venetian blinds move to the reference position (see 1.2). The frequency of the reference move is settable via the ETS.
1.1 Slat position

1.2 Screen position for DC Encoder Motors (LW 25 E83)

- Reference position:
  - is moved to with each UP command as long as no end positions have been stored.
  - is moved to with first UP command following mains voltage interruption.
  - is moved to after programming the end position with each 20th UP command (frequency settable via ETS)

- Upper end position in mm

- Bottom end position in mm (lower edge of slats packet up to end position)
2 Assembly

Mounting of the Motor Controller 4 DC/E WM

Switch box

Complete wiring and connect power supply

3 Wiring diagram

Local push button inputs can be used as binary inputs!
### 3.1 Motor outputs

Max. current per output: 500 mA.
Compatibel with the following Somfy motors in combination with the CTS 25 enrolling system for Venetian blinds:

- **LV 25-B44, -B64**
  - DC-Mode
  - 2 wires

- **LW 25-B44, -B83**
  - DC Mode
  - 2 wires

- **LW 25-E83**
  - DCE-Mode
  - 3 wires

- **LT 28-B73**
  - DC Mode
  - 2 wires

△ Control of non Somfy motors only on request

### 3.2 Cabling

△ As soon as the 230 V and the KNX bus voltage supply are attached, the "US" LED blinks regularly. The device is operational when the "US" LED is blinking continuously.

### 3.3 Checking the move directions of the end products

#### Group control of the motors 1 – 4 over the group control input

The move directions of the motors can be checked via the group inputs. All four motor outputs are switched simultaneously. This input can be blocked in the ETS parameters. In the event of bus power failure, it is always freed to allow emergency operation.

△ When starting up, make absolutely sure that the motors move in the right direction. This check can be carried out by making a wiring bridge at the group input.

Check the correct move direction of the end product

**DOWN:** The end product moves down (bridge between C + ▼)

**STOP:** The end product stops (bridge between C + ▼ + ▲)

**UP:** The end product moves upwards (C + ▲)
If the Venetian blind has been moved down completely or partly, pay attention to the slats position when checking the turning direction (respect the manufacturer’s instructions!).
If the slats position according to manufacturer’s description does not match to the move direction, only after first contacting the Venetian blind manufacturer can the Venetian blinds be corrected. Then, the turning direction can be checked.

3.4 Checking the turning direction of the slats

- „Solar protection application“
- „Decorative application“

Outside | Inside
---|---
DOWN | UP

Outside | Inside
---|---
DOWN | UP
The KNX 4 DCE Motor Controller can be used in the delivery state also without prior programming by the ETS software. Practical presets are implemented in the device. These settings apply to all four motor outputs.

- **Running and tilting times/lengths***
  In the delivery state or after setting back to the delivery state, the predefined running and tilting times/lengths* are already preset.

- **Mode selection DCE**
  A running length* of approx. 35 cm is preset.
  The turning impulses* are preset to 110 (suitable for 25 mm slats in combination with CTS winding system).
  The impulses for mechanical compensation are preset to 0.5 seconds.

- **Mode selection DC**
  A running time of 3 minutes and a turning time of 3 seconds are preset.
  The time for mechanical compensation is preset to 0.5 seconds.

- **Connection of local push buttons possible**
  The local push button inputs are assigned directly to the motor outputs: push button 1 controls motor output 1.
  Through wire bridges on the push button inputs, the motor outputs can be controlled as desired.

*⚠️ See chapter 1 definitions

### 4.1 Function of the Reset/Prog button

⚠️ The basic settings in the KNX Motor Controller can be made using this push button. These basis settings are possible only in the delivery state, before the device with the ETS was programmed, or after the device was unassigned by the ETS.

The basis settings are overwritten by the settings in the ETS.

### 4.2 Selection of different user ergonomics

Using the Reset/Prog button the press button user ergonomics for the local push button inputs or Somfy RTS radio hand transmitter can be determined. These settings are possible only in the delivery state, before the device is programmed with ETS software or after the device is unassigned with the ETS.

As soon as the device with the ETS is programmed, no further settings of the user ergonomics can be made via the Reset/Prog button. When the device is unassigned by the ETS, the adjusting of the user ergonomics is possible again via the Reset/Prog button.

⚠️ The selection of the user ergonomics must match with the corresponding end product.

#### Changing the ergonomics:

- **Configuration of the animeo RTS radio module**
  - SCR = Screen ergonomics*
  - EU = Venetian blind, EU ergonomics*
  - US = Venetian blind, US ergonomics*
  * see chapter 1 definitions

The delivery state is Venetian blind with EU ergonomics

To change to different ergonomics press briefly the Reset/Prog button. Repeat till such time as the desired LED shines.

Save and exit the setting mode
4.3 Mode selection DC or DCE

Type of motors that can be controlled (△ Preset mode is DCE):

- DC
- DCE (when a LW25-E3 Motor is used, it is identifiable by the three wires (white, grey, purple))

The motor can be damaged through an unauthorised function mode!
The mode for all four motor outputs are commonly defined!

4.4 Manual setting of the running and tilting times

The running and tilting times per motor output can be set via local conventional push buttons. These settings are possible only in the delivery state before the device has been programmed with the ETS. As soon as the device with the ETS is programmed, the running and tilting times can no longer be set via local conventional push buttons. Manually learned-in durations of running and tilting times are overwritten when programmed with ETS. When the device is unassigned by the ETS, the adjusting of the running and tilting times via local conventional push buttons can be done again.

△ Alternatively to the conventional push buttons, the settings can also be done using the Somfy RTS Transmitter and animeo RTS Radio Module (Ref. 1860105). A setting using animeo KNX RTS Receiver (Ref. 1860191) resp. animeo EnOcean Receiver (ref. 1860220) or animeo KNX EnOcean Receiver (ref. 1860229) and EnOcean transmitter is not possible!

△ Press immediately when lower end position is reached
△ Hold Stop during the complete turn
4.5 Manual setting of the intermediate position 1

Intermediate position 1 can also be programmed over a conventional local switch or by radio hand transmitters individually per motor output. At the same time, it is possible to carry out the intermediate position 1 via settings in the ETS parameters. Prior to this, the running and tilting times must be learned-in!

⚠ Alternative to the conventional push button the settings can also be implemented with Somfy RTS transmitter and animeo RTS radio module (ref. 1860105). Settings with animeo KNX RTS Receiver (ref. 1860191) and Somfy RTS transmitter resp. animeo EnOcean Receiver (ref. 1860220) or animeo KNX EnOcean Receiver (ref. 1860229) and EnOcean transmitter are not possible!

⚠ The last learned-in position is valid.

△ When using DCE motors (LW25-E83) a complete UP command must be executed after learning-in the running and tilting times (lengths) so that the according blind can find its upper reference point.

4.6 Resetting to delivery state

1. When the device has not been programmed with the ETS software.

   Full RESET: The settings made via the Reset/Prog push button, local conventional push buttons or radio transmitters can be reset over the Reset/Prog button by pressing 10 seconds.

2. When the device has been programmed with the ETS software.

   When the device has been programmed with the ETS software, a reset in the delivery state is no longer possible via the Reset/Prog button. Over the function “Unload” in the ETS, all settings of the device can be set back in the delivery state. The Reset/Prog button is then freed again.
At the most, 160 communication objects are available for use, but not all at once. A maximum of 250 group addresses can be connected.

| 42  | Motor 1 Error indication 1)                     | 1 Bit  |        | With this communication object an error for the corresponding motor can be signalled. When an error occurs, a telegram with the value "1" is sent. When the error has been corrected, a telegram with the value "0" is sent. The following errors are identified:  
  - Short circuit on the motor output or at least a wire is not connected.  
  - Encor wire (purple) is connected incorrectly on the motor output (e.g. M1 connector 1 or 2).  
  - A DCE motor is connected, the Motor Controller is however in the DC mode. |
| 43  | Motor 2 Error indication 1)                     | 1 Bit  |        |                                                                                                                                           |

</tr>
</tbody>
</table>
The selection options of the single parameters are described in each case. The defaults are printed in italics. In the following illustrations of the different menu index cards the maximum number of parameters is shown. Besides this and depending on the parameter settings, objects which are not required are blended out.

6.1 Menue index card "General"

Selection of motor type

Options:
- DC without Encoder
- DC with Encoder

Over the parameters it is defined which motors are to be connected to the motor outputs. DC motors without encoder have a two-wire connecting cable (white, gray). DC motors with encoder have a three-wire connecting cable (white, gray, purple).

DC motors without encoder: Somfy LV 25-B44 and B64, Somfy LW 25-B44 and B83, Somfy LT 28-B73, J101
DC motors with encoder: Somfy LW 25-E83

The selection of the motor type applies to all four motor outputs.

Motor output link

Options:
- 1+1+1+1
- 2+1+1
- 2+2

Over this parameter, the motor outputs can be connected device–internally with each other. A connection is necessary when for example, two motors are used to control a screen. This means that two motors are integrated into one Din rail and move one motor. Independent of the type of connection, 2+1+1 or 2+2, all motor cables must be connected to the motor outputs. To control the motor outputs, only the object and parameter of one motor must be parametered. For example when connecting 2+1+1 only the objects and parameters for motor 1.
Motor output configuration

Options:
- Combined
- Individual

With these parameters, the settings of the motor outputs are made as to whether "Combined" or "Individual". If the parameter "Combined" is selected, only one menu index card becomes visible for the basic settings of all four motor outputs (motor 1–4).

⚠ The selection "Combined" is recommended for projects for which the settings of the motor outputs are the same.

If the parameter "Individual" is selected, four single cards become visible for the standard settings of the motor outputs (motor 1, motor 2, ...).

Motor 1...4
Automatic/manual functions

Options:
- None
- Priority automatic functions
- Priority manual functions

- None:
The move commands are carried out in the incoming order sequence.

- Priority automatic functions:
If an automatic command (1 Byte move command) occurs before a manual command (1 Bit move command), all manual commands are closed. The objects at the start-up of the intermediate positions 1 and 2 (objects 21–30) are also closed. A manual command is also generated over the local push button inputs or via the radio hand transmitter. However, a tilting command (1 bit) can always be made within the parametered tilting time. A reset of the priority automatic function occurs when "Priority reset" (74–77) receives "1" or "0" on the corresponding object. Shifting between priority manual functions (value "0") and priority automatic functions (value "1") is done over the corresponding objects (70–73). After changing over to the corresponding priority the function is again in the reset state. This means that for priority automatic functions the manual commands are blocked only with the next automatic command.

- Priority manual functions:
When a manual command (1 Bit) occurs before an automatic command (1 Byte), all automatic commands are blocked. A manual command is also generated over the local push button inputs or the radio hand transmitter. A reset of the priority manual function occurs when "Priority reset" (74–77) receives "1" or "0" on the corresponding object. Shifting between priority manual functions (value "0") and priority automatic functions (value "1") is done over the corresponding objects (70–73). After changing over to the corresponding priority the function is again in the reset state. This means that for priority automatic functions the manual commands are blocked only with the next automatic command.

⚠ See chapter 1 Definitions.

- Over the priority manual function the user has the option of switching off the automatic functions. User comfort can be defined, for example, with a timer. At 8:00 o'clock the priority manual function is activated over the corresponding object (70–73) and the user can move to the desired position using the manual functions until priority automatic functions are switched over at around 17:00 on priority automatic functions toggles. Over the corresponding object (70–73), switching to and from priority manual function and priority automatic function can be done at any time.

To set the timer, ideally the façade controller animeo KNX Master Control W2 (Ref. 1860187) or animeo KNX Master Control W8 (Ref. 1860193) can be used.
### 6.2 Menu index card "General 2"

#### Use universal binary inputs

<table>
<thead>
<tr>
<th>Options</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• No</td>
<td></td>
</tr>
<tr>
<td>• Yes</td>
<td></td>
</tr>
</tbody>
</table>

With the parameter "Yes", four further menu index cards open (push button binary input 1...4). Now the local push button inputs can be connected over the corresponding objects (78-109). A conventional push button can thus be used for the most different of functions. For example, Switching, Venetian blind function, Dimming or Sending a value.

#### Use radio binary inputs

<table>
<thead>
<tr>
<th>Options</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• No</td>
<td></td>
</tr>
<tr>
<td>• Yes</td>
<td></td>
</tr>
</tbody>
</table>

With the parameter "Yes" a menu index card opens (General: Radio binary input), over which five further menu index cards can be activated (Radio binary input 1...5). Now the radio channels can be connected over the corresponding objects (110-159). A radio transmitter can be used thus for the most different of functions.

#### Slat position closed/reversed

**ONLY FOR VENETIAN BLINDS**

<table>
<thead>
<tr>
<th>Options</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Max. closed (255) / Max. reversed (0)</td>
<td></td>
</tr>
<tr>
<td>• Max. closed (0) / Max. reversed (255)</td>
<td></td>
</tr>
</tbody>
</table>

- **Max. closed (0) / Max. reversed (255)**
  - If a value of "255" to the corresponding object is transmitted (13-16), the slats are closed at maximum.
  - If a value of "0" to the corresponding object is transmitted (13-16), the slats are turned or opened at maximum.

- **Max. closed (0) / Max. reversed (255)**
  - If a value of "0" to the corresponding object is transmitted (13-16), the slats are closed at maximum.
  - If a value of "255" to the corresponding object is transmitted (13-16), the slats are turned or opened at maximum.
Group control input

Options:  
- **Disabled**
- **Enabled**

Over this parameter it is determined whether the input is blocked to the group control or is freed. Over this input all four motors are selected at the same time. Regardless of the parameter settings, the security settings (objects 32–41) have higher priority. If one of the security objects is active, the input to the group control is blocked.

⚠️ With a bus power failure this input is freed. Even if it is blocked over the parameter settings it can be used as an emergency service. With bus voltage return this input is blocked according to parameter settings or is freed.

6.3 Menue index card “Motor 1…4, with Encoder”

Four single menu index cards (motor 1 ... 4) become visible if in the menu of the basic setting "General" the parameter setting "Individual" is selected. One menu index card (motor 1 – 4) becomes visible if in the menu of the basic setting "General" the parameter setting "Combined" is selected.

⚠️ The basic setting of the motors are different, depending on the selection of the motor type on the card "General" (DC without encoder or DC with encoder).

The following parameter descriptions are related to the selection of the motor type "DC with encoder":

Type of end product

user ergonomics

Options:  
- Venetian blind with EU ergonomics
- Venetian blind with US ergonomics
- Roller blind

- **Venetian blind with EU ergonomics**
  
  With this parameter it is determined that the Venetian blind in EU ergonomics is selected over the local push button inputs or via the Somfy RTS radio transmitter. When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.

⚠️ For an explanation of EU/US and screen ergonomics see chapter 1 Definitions.
- **Venetian blind with US ergonomics**
  With this parameter it is determined that the Venetian blind in US ergonomics is selected over the local push button inputs or via the Somfy RTS radio transmitter.
  When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.
  △ For an explanation of EU/US ergonomics and screen ergonomics see chapter 1 Definitions.

- **Roller blind**
  With this parameter it is determined that the corresponding blind is selected over move/stop commands when the controlling is done over the local push button inputs or via the Somfy RTS radio hand transmitter.
  When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.
  △ For an explanation of EU/US and screen ergonomics see chapter 1 Definitions.

### Upper end limit in mm (0–5000)

Options:
- 0
- 0–5000 millimetres

The parametered lengths in millimetres defines the upper end position of the blinds.
△ Explanation; see chapter 2, blinds position for DC motors with encoder (LW 25 E83)

### Lower end limit in mm (0–5000)

Options:
- 350
- 0–5000 millimetres

The parametered lengths in millimetres defines the lower end position of the blinds.
△ Explanation; see chapter 2, blinds position for DC motors with encoder (LW 25 E83)

### Speed UP in RPM (25–56)

Options:
- 35
- 25–56

The parametered speed defines the speed for the move in the upper end position.

### Speed DOWN in RPM (25–56)

Options:
- 45
- 25–56

The parametered speed defines the speed for the move in the lower end position.

### Impulses for tilting (0–255)

Options:
- 110
- 0–255

The parametered impulses here define the maximum slat tilting. This parameter is only visible when the type of product/user ergonomics, either Venetian blinds with EU ergonomics or Venetian blinds with US ergonomics, is selected.
△ Setting recommendation: With a slat width of 25 mm = approx. 110 impulses for the tilting.
With a slat width of 16 mm = approx. 90 impulses for the tilting.
**Step impulses (3–255)**

Options:  
- 10
- 3–255

The impulses parametered here define the impulses for a tilting step. This parameter is only visible when the type of product/user ergonomics, either Venetian blind with EU ergonomics or Venetian blind with US ergonomics, is selected.

**Speed tilting in RPM (5–56)**

Options:  
- 15
- 5–56

The speed parametered here defines the slats tilting speed. This parameter is only visible when the type of product/user ergonomics, either Venetian blinds with EU ergonomics or Venetian blinds with US ergonomics, is selected.

**Impulses for slack compensation**  
**Basis 0,05s (0–255)**

Options:  
- 20
- 0–255

The parametered impulses here define the impulses which are added to the impulses for tilting to balance out mechanical tolerances. This parameter is only visible when the type of end product/user ergonomics, either Venetian blind with EU ergonomics or Venetian blind with US ergonomics, is selected.

### 6.4 Menu index card “Motor 1...4”

Four single menu index cards (motor 1 ... 4) become visible if in the menu of the basic setting “General” the parameter setting “Individual” is selected. One menu index card (motor 1 - 4) becomes visible if in the menu of the basic setting “General” the parameter setting “Combined” is selected.

⚠️ The basic setting of the motors are different, depending on the selection of the motor type on the card “General” (DC without encoder or DC with encoder).
The following parameter descriptions are related to the selection of the motor type "DC without encoder":

**Type of end product**

**User ergonomics**

Options:
- Venetian blind with EU ergonomics
- Venetian blind with US ergonomics
- Roller blind

- **Venetian blind with EU ergonomics**
  - With this parameter it is determined that the Venetian blind in EU ergonomics is selected over the local push button inputs or via the Somfy RTS radio transmitter.
  - When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.
  - △ For an explanation of EU/US and screen ergonomics see chapter 1Definitions.

- **Venetian blind with US ergonomics**
  - With this parameter it is determined that the Venetian blind in US ergonomics is selected over the local push button inputs or via the Somfy RTS radio transmitter.
  - When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.
  - △ For an explanation of EU/US and screen ergonomics see chapter 1Definitions.

- **Roller blind**
  - With this parameter it is determined that the corresponding blind is selected over move/stop commands when the controlling is done over the local push button inputs or via the Somfy RTS radio hand transmitter.
  - When the local push button inputs are used as universal push button inputs, the operating ergonomics are defined over the corresponding parameters (short/long pressing of the push button). The operating ergonomics using a Somfy RTS radio transmitter remains unchanged.
  - △ For an explanation of EU/US and screen ergonomics see chapter 1Definitions.

**Running time UP (1–320s)**

Options:
- 120
- 1–320 seconds

The time parametered here is the maximum running time from the lower end position to the upper end position. An excess time of 5 seconds is always added, except with position telegrams (objects 9–12). If a position telegram with the value "0" is sent to the corresponding object, an excess time of 5 seconds is still added to it.

**Running time DOWN (1–320s)**

Options:
- 120
- 1–320 seconds

The time parametered here is the maximum running time from the upper end position to the lower end position. An excess time of 5 seconds is always added, except with position telegrams (objects 9–12). If a position telegram with the value "255" is received on the corresponding object, an excess time of 5 seconds is still added to it.

**Complete tilting time**

**Base 0.1s (0–100)**

Options:
- 30
- 0–100

The time parametered here is the maximum tilting time of the slat. This parameter is only visible when the type of end product, Venetian blind with EU ergonomics or Venetian blind with US ergonomics, have been selected.
Step length
Base 0.01s (3-255)

Options:  
- 10
- 3 - 255

The time parametered here is the running time for a tilting step. This parameter is only visible when the type of product/user ergonomics, either Venetian blind with EU ergonomics or Venetian blind with US ergonomics, is selected.

Tilting speed (0-100%)

Options:  
- 60
- 0 - 100

This parameter defines the speed in which the slats are tilting. Value "0" defines the slowest tilting speed, value "100" defines the fastest tilting time.

Slack compensation
Base 0.05s (0-100)

Options:  
- 10
- 0 - 100

The time for slack compensation is active as soon as a higher value than "0" is entered. The time parametered here defines the time which is added to the parametered complete slat tilting to balance out mechanical tolerances. This time is always added with the first UP turn of the slats when the type of end product, Venetian blinds with EU ergonomics or Venetian blind with US ergonomics, have been selected.

Tension relief when reaching the upper end limit

Options:  
- No
- Yes

⚠️ With this parameter it is possible to extend the life of the end product (Venetian blinds).

By selecting "Yes" the Venetian blinds are relieved when reaching the upper end position. This means, shortly after reaching a minimal DOWN command is generated. As a result the Venetian blind is relieved of the strain whilst standing in the upper end position. By relieving the pull cords they are not unnecessarily strained. Thus life span is extended.

Automatic slat shake

Options:  
- No
- Yes

With selection of "Yes" the slats tilt automatically when reaching the lower end limit. Here, the slats are once completely opened and closed.

⚠️ This function allows to possibly set up the slats automatically. It may happen that during a DOWN order some slats get entangled in the tilting cords and therefore do not stop in the mechanical default position. With a complete opening and closing of the slats the entangled ones go back into the mechanical default position.
Four single menu index cards (functions motor 1...4) become visible if in the menu of the basic setting "General" the parameter setting "Individual" is selected. One menu index card (motor 1 - 4) becomes visible if in the menu of the basic setting "General" the parameter setting "Combined" is selected.

⚠️ The parameters which become visible on this parameter card are independent of the selection of the motor type (DC without Encoder or DC with Encoder) on the parameter card “General”. The parameters for the setting of functions are identical for both motor types.

### Intermediate position 1
UP / DOWN Position (0-100%)

Options:
- 0
- 0 - 100

With this parameter the intermediate position 1 "UP / DOWN" is defined. The set value in % refers to the parametered running times and lengths of the corresponding blind of the menu index card Motor 1...4.

If the IP Up/Down position parameter is set to 0 %, the IP position is disabled. This function avoids any movement of the blinds by using the "my" or IP push button.

### Slat position (0-100%)

Options:
- 0
- 0 - 100

With this parameter the intermediate position 1 "Slat" is defined. The set value in % refers to the parametered complete tilting time of the corresponding blind of the menu index card Motor 1...4.

⚠️ Intermediate position 1 can be learned-in individually via conventional local push buttons, or by a radio handheld transmitter per motor output. In addition, the last learned-in position applies.

### Intermediate position 2
UP / DOWN position (0-100%)

Options:
- 0
- 0 - 100

With this parameter the intermediate position 2 "UP / DOWN" is defined. The set value in % refers to the parametered running times and lengths of the corresponding blind of the menu index card Motor 1...4.
If the IP Up/Down position parameter is set to 0 %, the IP position is disabled. This function avoids any movement of the blinds by using the "my" or IP push button.

**Slat position (0–100%)**

Options:
- 0
- 0 – 100

With this parameter the intermediate position 2 "slat" is defined. The set value in % refers to the parametered complete tilting time of the corresponding blind of the menu index card Motor 1...4.

**Block position orders (1 Byte)**

Options:
- No
- Yes

UP/DOWN orders (Byte) can be blocked per object (65–69) using this parameter. If a telegram with the value "1" is received on the corresponding object during a blinds move, this move is carried out up to the end. Only then are further UP/DOWN orders (Byte) blocked. If a telegram with the value "0" is received on the corresponding object, the UP/DOWN orders (Byte) are released again.

**Block slat orders (1 Byte and 4 Bit)**

Options:
- No
- Yes

Step/stop and turn commands (1 Byte and 4 Bit) can be blocked per object (65–69) using this parameter. If a telegram with the value "1" is received on the corresponding object during a blinds turn, this turn is carried out up to the end. Only then are further turn commands (1 Byte and 4 Bit) blocked. If a telegram with the value "0" is received on the corresponding object, the step/stop or turn commands (1 Byte and 4 Bit) are released again.

**Block UP/DOWN orders (1 Bit and 4 Bit)**

Options:
- No
- Yes

UP/DOWN orders (Bit) can be blocked per object (65–69) using this parameter. If a telegram with the value "1" is received on the corresponding object during a blinds move, this move is carried out up to the end. Only then are further UP/DOWN orders (Bit) blocked. If a telegram with the value "0" is received on the corresponding object, the UP/DOWN orders (Bit) are released again.

**Block Step/Stop orders (1 Bit)**

Options:
- No
- Yes

Step/stop and turn commands (Bit) can be blocked per object (65–69) using this parameter. If a telegram with the value "1" is received on the corresponding object during a blinds turn, this turn is carried out up to the end. Only then are further turn commands (Bit) blocked. If a telegram with the value "0" is received on the corresponding object, the step/stop or turn commands (Bit) are released again.

**Block local push button inputs and Somfy RTS orders**

Options:
- No
- Yes

Local push button inputs and the Somfy RTS radio signal can be blocked per object (65–69) using this parameter. If a telegram with the value "1" is received on the corresponding object during a motor movement, this turn is carried out up to the end. Only after completion are any further commands blocked which are generated via local push button inputs or Somfy RTS radio signals. If a telegram with the value "0" is received on the corresponding object, the local push button inputs and Somfy RTS radio signals are freed again.

⚠️ This function is deactivated for local push-button inputs if "Yes" has been selected in the "Use universal binary inputs menu index card (see section 6.2 on page 22).
Repeat last telegram after security

Options:  
- No
- Yes

If this parameter is set to "Yes", the last move command is repeated after security. This means that it will move to the position which was active before a telegram with the value "1" was input to one of the corresponding security objects, low or high.

### 6.6 Menue index card "Binary input 1…4, A/B"

General information for push button binary input

Four different basis functions can be selected for each push button input:

- Venetian blind, UP / DOWN
- Switch/Dry contact
- 8-Bit value (rising edge)
- Dimming

The single functions and parameters will be explained which arise depending on the selection of the basis functions. For this another basis function has been selected for each push button. The functions are described with the help of the input 1 contact A/B and are identical for the inputs 2-4, contacts C/D, E/F and G/H.

⚠️ For the basis function "Venetian blind UP / DOWN" attention must be paid to which contact "UP" or "DOWN" is switched. The same applies with selection of the basis function "Dimming", for "Brighter" or "Darker" dimming. The pre-setting of the basis function for the menu index card push button 1…4 is Venetian blind UP / DOWN.

**Basic function**

Options:  
- Venetian blind, UP / DOWN
- Switch/Dry contact
- 8-Bit value (rising edge)
- Dimming
Long operation (move) after

Options:  
- 0.5 seconds  
- 0.3 - 5.0 seconds

This parameter defines the activity time of the corresponding push button which distinguishes between the sending of a short-term telegram (Step/Stop) and a long-term telegram (UP / DOWN). If the time, for example, is set on 0.5 seconds, a long-term telegram is generated only with a longer pressing of the push button which is longer than 0.5 seconds. With a shorter activation which is smaller than 0.5 seconds, a short-term telegram is generated.

Contact type input A

Options:  
- Normally closed  
- Normally open

Over this parameter it is defined which type of contact is at the local input A. Normally closed: The contact at the local input is activated closed and not activated opened. Normally opened: The contact at the local input is activated opened and not activated closed.

Contact type input B

Options:  
- Normally closed  
- Normally open

Over this parameter it is defined which type of contact is at the local input B. Normally closed: The contact at the local input is activated closed and not activated opened. Normally opened: The contact at the local input is activated opened and not activated closed.

Basic function

Options:  
- Venetian blind UP / DOWN  
- Switch/Dry contact  
- 8-Bit value (rising edge)  
- Dimming
Edge evaluation contact A

Options:
- Rising ON, falling OFF
- Rising OFF, falling ON
- Rising ON
- Falling ON
- Rising OFF
- Falling OFF
- Rising toggle
- Falling toggle
- Rising toggle, falling toggle
- No evaluation

The corresponding object value "0" or "1" is generated depending on which edge evaluation is parametered.

- Rising ON, falling OFF
If a rising edge at the local input appears, the object value "On" is generated. If a falling edge at the local input appears, the object value "Off" is generated. The duration of the activation is not evaluated.

- Rising OFF, falling ON
If a rising edge at the local input appears, the object value "Off" is generated. If a falling edge at the local input appears, the object value "On" is generated. The duration of the activation is not evaluated.

- Rising ON
If a rising edge at the local input appears, the object value "On" is generated. If a falling edge at the local input appears, it is not evaluated. The duration of the activation is not evaluated.

- Falling ON
If a rising edge at the local input appears, the object value "On" is generated. If a rising edge at the local input appears, it is not evaluated. The duration of the activation is not evaluated.

- Rising OFF
If a rising edge at the local input appears, the object value "Off" is generated. If a falling edge at the local input appears, this is not evaluated. The duration of the activity is not evaluated.

- Falling OFF
If a falling edge at the local input appears, the object value "Off" is generated. If a rising edge at the local input appears, this is not evaluated. The duration of the activity is not evaluated.

- Rising toggle
If a rising edge at the local input appears, the object value is inverted. If a falling edge at the local input appears, this is not evaluated. The duration of the activity is not evaluated.

- Falling toggle
If a falling edge at the local input appears, the object value is inverted. If a rising edge at the local input appears, this is not evaluated. The duration of the activity is not evaluated.

- Rising toggle, falling toggle
If a rising or falling edge at the local input appears, the object value is inverted. The duration of the activity is not evaluated.

- No evaluation
If a rising or falling edge at the local input appears, this is not evaluated.

Edge evaluation contact B

Options:
- Rising ON, falling OFF
- Rising OFF, falling ON
- Rising ON
- Falling ON
- Rising OFF
- Falling OFF
- Rising toggle
- Falling toggle
- Rising toggle, falling toggle
- No evaluation

On ("1")  Off ("0")  Toggle ("1/0")
Send starting value on
Bus power return

Options:
• Yes
• No

If this parameter is set, the current state of the input is transmitted with the bus voltage return. If this parameter is set to "No", the current state of the input is not transmitted.

Ist dieser Parameter eingestellt, wird bei Busspannungswiederkehr der aktuelle Status des Eingangs gesendet. Ist dieser Parameter auf "Nein" gestellt, wird der aktuelle Status des Eingangs nicht gesendet.

Contact A and B
Cyclic sending of status

Options:
• No cyclic sending
• On
• Off
• On and Off

With this parameter it is defined whether the corresponding switch value of the communication object should be transmitted cyclically.

• No cyclic sending
The switching value of the communication object is not transmitted cyclically.

• On
If the object value is "1", this is transmitted cyclically. If the object value changes by edge change at the local input or reception of a telegram on "0", the cyclic sending stops.

• Off
If the object value is "0", this is transmitted cyclically. If the object value changes by edge change at the local input or reception of a telegram on "0", the cyclic sending stops after "1".

• On and Off
If the object value is "1" or "0", this is transmitted cyclically. If the object value changes by edge change at the local input or with reception of a telegramme, the current object value is transmitted cyclically.

Cyclic sending in sec. (1-3600)

Options:
• 5
• 1 - 3600

With this parameter the time intervals are defined in which the corresponding object value should be transmitted cyclically.

⚠ Please note that cyclical supervision time of the receiver is approx. 1/4 higher than that of the transmitter.
Basic function

Options:
- Venetian blind UP / DOWN
- Switch/Dry contact
- 8-Bit value (rising edge)
- Dimming

Contact A
Value on rising edge (0-255)

Options:
- 0
- 0 - 255

With this parameter the value is set which is transmitted with a rising edge to the local input A.

Contact type input A

Options:
- Normally open
- Normally closed

With this parameter it is defined which contact type is at the local input A. Normally open: The contact at the local input is activated closed and not activated opened. Normally closed: The contact at the local input is activated opened and not activated closed.

Contact B
Value on rising edge (0-255)

Options:
- 0
- 0 - 255

With this parameter the value is set which is transmitted with a rising edge at the local input B.

Contact type input B

Options:
- Normally open
- Normally closed

With this parameter it is defined which contact type is at the local input B. Normally open: The contact at the local input is activated closed and not activated opened. Normally closed: The contact at the local input is activated opened and not activated closed.
**Basic function**

**Options:**
- Venetian blind UP / DOWN
- Switch/Dry contact
- 8-Bit value (rising edge)
- Dimming

**Long operation (dimming) after**

**Options:**
- 0.5 seconds
- 0.3 - 0.5 seconds

This parameter defines the activity time of the corresponding push button which makes a distinction between the sending of a switching telegram and a dimming telegram. If the time, for example, is parametered on 0.5 seconds, a dimming telegram is generated only after a press activation longer than 0.5 seconds is made. With a pressing shorter than 0.5 seconds a switch telegram is generated.

**Input A/B**

**Options:**
- On/Off
- Toggle/Toggle

On ("1")  Off ("0")  Toggle ("1/0")

This parameter defines the value which is transmitted with a short pressing of the corresponding input.

- **On/Off**
  With a short pressing of the push button at the input **A**, an "Off" telegram is generated. With a short activity of the corresponding push button at the input **B**, an "On" telegram is generated. This function can be inverted by changing over the clamps at the inputs.

- **Toggle/Toggle**
  Switching over can be done with a short pressing of the push button at the input **A** or **B**. This means that the value which is in the corresponding switching object is firstly inverted and is then transmitted.
Contact type input A

Options: • Normally closed  
• Normally open

With this parameter it is defined which contact type is at the corresponding local input. Normally open: The contact at the local input is activated closed and not activated open. Normally closed: The contact at the local input is activated open and not activated closed.

Contact type input B

Options: • Normally closed  
• Normally open

With this parameter it is defined which contact type is at the corresponding local input. Normally open: The contact at the local input is activated closed and not activated open. Normally closed: The contact at the local input is activated open and not activated closed.

Dimming with

Options: • Cyclic intervals  
• Stop telegram

• Cyclic intervals
With a short pressing of the push button at the local input A or B, an "On" or an "Off" telegram is generated over the corresponding object (1 bit). With a long pressing of the push button at the local input A brighter dimming is done over the corresponding object (4 bit) as long as the push button is pressed. When the push button is released on the local input A cyclical sending is stopped. The length of steps and the time duration for brighter dimming is made from the parameters "longer push button pressing (dimming)" and "interval for cyclical dimming".

With a long pressing of the push button at the local input B, darker dimming is done over the corresponding object (4 bit) as long as the push button is pressed. When the push button is released on the local input B, cyclical sending is stopped. The length of steps and the time duration for darker dimming is made from the parameters "longer push button pressing (dimming)" and "interval for cyclical dimming".

• Stop telegram
With a short pressing of the push button at the local input A or B, a telegram is generated over the corresponding object (1 bit). With a long pressing of the push button at the local input A brighter dimming is done over the corresponding object (4 bit). With a long pressing of the push button at the local input B, darker dimming is done over the corresponding object (4 bit). When the corresponding push button at the local input A or B is released, a stop command is generated.

Long operation (dimming)

Options: • Adjust by 100%  
• Adjust by 1/2  
• Adjust by 1/4  
• Adjust by 1/8  
• Adjust by 1/16  
• Adjust by 1/32  
• Adjust by 1/64

This parameter defines the dimming length of steps of the telegrams which are transmitted with a longer pressing.

⚠️ When "Dimming with cyclic intervals" is parametered, attention must be paid to the fact that the dimming length of steps and the interval for the cyclical dimming are matched to the dimming time of the actuator.

Interval for cyclic dimming

Options: • 0.5 seconds  
• 0.5 ~ 7.0 seconds

This parameter defines the duration of an interval for cyclical sending. If, for example, a "change 1/4" and an "interval of 0.5 seconds" is set, then with a longer pressing of the push button on the corresponding local input, every 0.5 seconds 1/4 brighter or darker will be dimmed.
The parameters set here refer to the push button inputs 1 - 4.

**Additional start-up delay**

Options:  
- 0 seconds
- 0 – 21 seconds

This parameter defines the time which is needed after bus voltage return, until the first telegram can be transmitted.

**Limit number of telegrams**

Options:  
- Yes
- No

This parameter opens the parameter to set the telegram rate limitation. In addition, the number of the telegrams which are transmitted cyclically per time unit can be limited.

**Limit**

Options:  
- 30 telegrams pro 17 sec.
- 60 telegrams pro 17 sec.
- 100 telegrams pro 17 sec.
- 127 telegrams pro 17 sec.

This parameter defines the number of telegrams which can be transmitted within 17 seconds.
On this menu index card, the reaction can be defined for every single motor output with bus power failure and bus power return.

**MOTOR 1 ... 4**
**Reaction at Bus power failure**

Options:
- **Upper end limit**
- **Lower end limit**
- **Ignore**
- **Intermediate position 1**
- **Intermediate position 2**

This parameter defines the position which is moved to with a bus power failure.

**MOTOR 1 ... 4**
**Reaction at Bus power return**

Options:
- **Upper end limit**
- **Lower end limit**
- **Ignore**
- **Intermediate position 1**
- **Intermediate position 2**

This parameter defines the position which is moved to with a bus power return.

**MOTOR 1 - 4**
**Reaction at mains power return (230V)**

Options:
- **Upper end limit**
- **Lower end limit**
- **Ignore**

This parameter defines the position which is moved to with a mains power return (230 V).
Automatic cascading

Options:  • No  • Yes

If this parameter is set on "Yes", the motor outputs with one second delay in each case move to the corresponding position. This delay time is taken into account with the start-up of the positions, which are generated from the settings "Reaction with bus voltage return" and "Reaction with mains voltage return (230 V)".

⚠ Advantage: Power spikes can thus be reduced in larger projects.

6.9 Menu index card "Feedback motor positions"

On this menu index card the parameters can be selected to announce the position status of the individual blinds on the bus. In addition, the generated status positions are based on the parametered running and tilting times of the menu index cards motor 1 ... 4 or motor 1 - 4.

Feedback of status
Upper/lower end positions

Options:  • No  • Yes

This parameter opens the parameter "Type of messaging".

Type of feedback
Upper/lower end positions

Options:  • Combined if all are up/down  • Individual

• Combined if all are up/down
If this parameter is selected, the corresponding upper or lower end position is only announced on the bus, when all four blinds have reached the upper (object 59) or lower (object 64) end position.

• Individual
If this parameter is selected, the corresponding upper or lower end position is announced on the bus for each blind individually. Here, the objects in each case (55–58 and 60–63) are made available.
**Motor 1 ... 4**

**Feedback of**

<table>

<tbody>
<tr>
<td>• UP/DOWN position</td>
</tr>
<tr>
<td>• Slat position</td>
</tr>
<tr>
<td>• UP/DOWN and slat position</td>
</tr>
<tr>
<td>• None</td>
</tr>
</tbody>
</table>

- **UP/DOWN position**
  Using this parameter the position UP/DOWN is sent on the bus for the corresponding motor depending on the parameter "Type of messaging" "0" = upper / "255" = lower.

- **Slat position**
  With this parameter the slat position is transmitted for the corresponding motor depending on the parameter "Type of messaging" on the bus. "0/255" = slats opened / "255/0" = slats closed. The value for the position of the slats which is transmitted over the corresponding object is dependent on the parameter settings on the menu index card "General". Slats turn Closed/Turned ONLY WITH VENETIAN BLIND.

- **UP/DOWN and slat position**
  With this parameter the position UP/DOWN and the position of the slats for the corresponding motor is transmitted on the bus depending on the parameter "Type of messaging": "0" = upper / "255" = lower, "0/255" = slats opened / "255/0" = slats closed. The value for the position of the slats which is transmitted over the corresponding object is dependent on the parameter settings on the menu index card "General". Slats turn Closed/Turned ONLY WITH VENETIAN BLIND.

- **None**
  No positions on the bus are messaged.

**Motor 1 - 4**

**Type of feedback**

<tr>
<td>• Cyclic</td>
</tr>
</tbody>
</table>

- **On demand**
  The current position of the blinds must be requested over object 54.

- **Status change**
  The current position of the corresponding blind is transmitted after every position change on the bus. The position is transmitted on the bus when the destination position is reached.

- **Cyclic**
  This parameter opens a further parameter ("Every") with which the time for cyclical sending is set.

**Every**

⚠️ With this parameter it is defined in which time intervals the current position of the corresponding blinds are messaged. The current position of the blinds is transmitted on the bus only during the move.
6.10  Menue index card "Safety motor 1-2 / motor 3-4 / motor 1-4"

Two single menue index cards (Safety motor 1-2 / Safety motor 3-4) become visible if on the menue index card "General" the basic settings of the motors are set on "Individual". One menue index card (Safety motor 1-4) becomes visible if on the menue index card "General", the basic setting of the motors is parametered on "Combined".

Below the parameters for motor 1 are described. The parameters for motor 2-4 are corresponding.

**MOTOR 1, security position**

**Low priority**

Options:  
- Upper end limit  
- Lower end limit  
- Intermediate position 1  
- Intermediate position 2  
- Ignore security  
- Stop

The "Security position low priority" for the corresponding blind is determined with this parameter. If a telegram with the value "1" is received on one of these communication objects (objects 32–36), the corresponding blind moves to the position parametered in the ETS parameters. If a telegram with the value "0" is received on one of these communication objects, no operation is carried out. Only if in the ETS parameters "Repeat the last telegram after security (Yes)" is selected, this operation will be carried out for the corresponding blind.

**MOTOR 1, security position**

**High priority**

Options:  
- Upper end limit  
- Lower end limit  
- Ignore security

The "Security position high priority" for the corresponding blind is determined with this parameter. If a telegram with the value "1" is received on one of these communication objects (objects 37–41), the corresponding blind moves to the position parametered in the ETS parameters. If a telegram with the value "0" is received on one of these communication objects, no operation is carried out. Only if in the ETS parameters "Repeat the last telegram after security (Yes)" is selected, this operation will be carried out for the corresponding blind.
Cyclic monitoring time in sec. (0–255)

Options:  
- 0
- 0 - 255

The cyclic monitoring time is active, as soon as a higher value than "0" is entered and refers to both security objects, low and high priority.

⚠ With active cyclic monitoring time, attention must be paid to the fact that the time of the cyclic transmitter is lower approx. 1/4 than the parametered cyclic monitoring time for both security objects, low and high priority. If the predefined value "0" remains set, the security objects react statically to the values "1" and "0".

6.11 Menue index card "Special functions motor 1-4"

Below the parameters for motor 1 are described. The parameters for motor 2-4 are corresponding.

⚠ This card is only visible with "Selection motor type DC with encoder" on the card "General".

Motor 1
Automatic slat shake

Options:  
- No
- Yes

With selection of "Yes" the slats tilt automatically when reaching the lower end limit. Here, the slats are once completely opened and closed.

⚠ This function allows to possibly set up the slats automatically. It may happen that during a DOWN order some slats get entangled in the tilting cords and therefore do not stop in the mechanical default position. With a complete opening and closing of the slats the entangled ones go back into the mechanical default position.
Motor 1
Reference counter (0-255)

Options:  
- 20  
- 0 - 255

This parameter defines when a reference move is carried out. It means, for example, that after 20 Up/Stop telegrams a reference move will be carried out.

△ See also chapter 1, Definitions

Motor 1-4
Reference move after ETS download

Options:  
- No  
- Yes

With selection of "Yes", a reference move is carried out with each ETS download.

△ See also chapter 1, Definitions

6.12 Menu index card "General: Radio binary input"

General information for radio binary input

For every radio binary input there are five different basis functions for selection:

Options:  
- Venetian blind UP / DOWN  
- Switch/Dry contact  
- 8-Bit value (rising edge)  
- Dimming  
- Slow tilting

The single functions and parameters which arise depending on the selection of the basis functions are now described. To illustrate this, another basis function has been selected for each radio input. The functions are described with the help of the radio input 1 (channel A) and are identical for the radio inputs 2 – 5 (channel B, C, D and E).

The preset of the basis function for the menu index card radio input 1... 5 is Venetian blinds UP/DOWN.
Radio binary input 1...5

For every radio input there are five different basis functions for selection:

- **No**
- **Yes**

With choosing "Yes" the additional menu index cards "Radio binary input 1...5" become visible. At the same time the necessary objects appear.

### 6.13 Menu index card “General: Radio binary input 1...5”

**Basis function**

- **Venetian blind Up/Down**
- **Switch/Dry contact**
- **8-Bit value**
- **Dimming**
- **Slow tilting**

**Long operation (move) after**

- **0.5 seconds**
- **0.3...5.0 seconds**

This parameter defines the activity time of the corresponding transmitter push button which distinguishes between the sending of a short-term telegram (Step/Stop) and a long-term telegram (UP/ DOWN). If the time, for example, is parametered on 0.5 seconds, then only after a pressing of more than 0.5 seconds is a long-term telegram generated. With a pressing of the push button which is shorter than 0.5 seconds, a short-term telegram is generated.

**Functionality of the "my" push button**

- **1-Bit value**
- **8-Bit value**
- **No function (no evaluation)**
Functionality of the "my" push button

1-Bit value

Options:  
- On
- Off
- Toggle
- No function (no evaluation)

- On  
If the "my" button in the radio transmitter is pressed, the object value "On" is generated. The duration of the activity is not evaluated.

- Off  
If the "my" button in the radio transmitter is pressed, the object value "Off" is generated. The duration of the activity is not evaluated.

- Toggle  
If the "my" button in the radio transmitter is pressed, the object value "At" is generated. The duration of the activity is not evaluated.

- No function (no evaluation)  
If the "my" button in the radio transmitter is pressed, this is not evaluated.

8-Bit value (rising edge)

Options:  
- 0
- 0 - 255

- 0 - 255  
With this parameter the value is set which is transmitted while pressing the "my" button in the radio transmitter.

- No function (no evaluation)  
If the "my" button in the radio transmitter is pressed, this is not evaluated.

Options:  
- Venetian blind UP / DOWN
- Switch/Dry contact
- 8-Bit value
- Dimming
- Slow tilting
Functionality of the "UP" push button

Options:  
- On
- Off
- Toggle
- No function (no evaluation)

- **On**
  If the "my" button in the radio transmitter is pressed, the object value "On" is generated. The duration of the activity is not evaluated.

- **Off**
  If the "my" button in the radio transmitter is pressed, the object value "Off" is generated. The duration of the activity is not evaluated.

- **Toggle**
  If the "my" button in the radio transmitter is pressed, the object value "At" is generated. The duration of the activity is not evaluated.

- **No function (no evaluation)**
  If the "my" button in the radio transmitter is pressed, this is not evaluated.

Functionality of the "DOWN" push button

Options:  
- On
- Off
- Toggle
- No function (no evaluation)

For a description please see "Function of the "UP" button with shadow".

Functionality of the "my" push button

Options:  
- 1-Bit value
- 8-Bit value
- No function (no evaluation)

For a description please see "Function of the "my" button with Venetian blind UP/DOWN".

On ("1") Off ("0") Toggle ("1/0")

On ("1") Off ("0") Toggle ("1/0")
Options:
- Venetian blind Up/Down
- Switch/Dry contact
- 8-Bit value
- Dimming
- Slow tilting

Value of the "Up" push button

Options:
- 0
- 0 - 255

0 - 255
With this parameter the value is set which is transmitted while pressing the "UP" button in the radio transmitter.

Value of the "Down" push button

Options:
- 0
- 0 - 255

For a description please see "Functionality of the "UP" button with 8-Bit value".

Functionality of the "my" push button

Options:
- 1-Bit value
- 8-Bit value
- No function (no evaluation)

For a description please see "Functionality of the "my" button with Venetian blind UP/DOWN".
Basic function

Options:
- Venetian blind Up/Down
- Switch/Dry contact
- 8-Bit value
- Dimming
- Slow tilting

Long operation (move) after

Options:
- 0.5 seconds
- 0.3...5.0 seconds

This parameter defines the pressing time of the corresponding transmitter push button (Up/Down) which makes a distinction between the sending of a short-term telegram (On/Off) and a long-term telegram (Brighter/darker dimming). If the time, for example, is set at 0.5 seconds, a long-term telegram is generated after a longer pressing than 0.5 seconds. With a pressing duration which is shorter than 0.5 seconds, a short-term telegram is generated.

Dimming brighter/darker for

Options:
- Adjust 1/8
- Adjust 100 % ... 1/64

This parameter defines the dimming step length which is transmitted as a telegram with a long pressing of the push button.

Functionality of the "my" push button

Options:
- 1-Bit value
- 8-Bit value
- No function (no evaluation)

For a description please see "Functionality of the "my" button with Venetian blind UP / DOWN".
Basic functions

Options:
- Venetian blind UP/DOWN
- Switch/Dry contact
- 8-Bit value
- Dimming
- Slow tilting

Long operation (move) after

Options:
- 0.5 seconds
- 0.3...5.0 seconds

This parameter defines the pressing time of the corresponding transmitter push button (Up/Down) which makes a distinction between the sending of a short-term telegram (Up/Down) and a long-term telegram (Open/Close). If the time, for example, is set at 0.5 seconds, a long-term telegram is generated after a longer pressing than 0.5 seconds. With a pressing duration which is shorter than 0.5 seconds, a short-term telegram is generated.

Tilts slat (open/close) slowly by

Options:
- Adjust 1/8
- Adjust 100%...1/64

This parameter defines the tilting of the Venetian blinds which is transmitted as a telegram with a long pressing of the push button.

Functionality of the "my" push button

Options:
- 1-Bit value
- 8-Bit value
- No function (no evaluation)

For a description please see "Function of the "my" button with Venetian blind UP/DOWN".
7 Diagnosis

7.1 LEDs on the animeo KNX Motor Controller

The LEDs on the animeo KNX Motor Controller can be used for the following functions:

- Functionality of the device during operation (230 V / KNX bus voltage connected, indication via radio signals, ...)
- A limited overview of the settings

7.2 Informationen during operation

Receiving of radio message ......................................................
Safety low/high or object "block function" is active .........................
The device is ready for operation, display reception KNX telegram ........

7.3 Status of the configuration

⚠️ The call-up of the status of configuration is possible only in the delivery state, before the device was programmed with the ETS. As soon as the device is programmed with the ETS, the status of the configuration can no longer be called up over the Reset/Prog button. When the device is unloaded by the ETS, the status of the configuration can be called up again over the Reset/Prog button. A call-up of the status is always possible over radio functionality (green upper LED).

For an explanation of EU / US ergonomics see chapter 1 Definitions.
7.4 First diagnosis

7.4.1 Warning LED (△) on the Motor Controller

When an UP or DOWN command is given and the warning LED flashes red (△ excess current), the following points must be checked:
- Short circuit on the motor output or at least a wire is not connected.
- Encoder wire (purple) is connected incorrectly on the motor output (e.g. M1 connector 1 or 2).
- A DCE motor is connected, the Motor Controller is however in the DC mode.
- A DC motor is connected, the Motor Controller is however in the DCE mode.

In the mode selection DCE:
When an UP or DOWN command is given and the warning LED flashes yellow (△ regulator error), the set speed concerning the size of the Venetian blinds is too high. The set time for the UP and DOWN direction must be appropriate (increased).

7.4.2 Visual display with error identifying

Motor 1 ..........................................
Motor 2 ..........................................
Motor 3 ..........................................
Motor 4 ..........................................

To switch off the error display briefly press the Reset/Prog button (0.5 seconds).
